

CS151 Intro to Data Structures

Iterators
Recursion
Binary Search

Announcements

- Lab5 and HW03 due Friday
- Lab4 and HW4 due at end of fall break (Oct 20)
- If you're missing some assignments, chance to redo them over fall break...
- No professor office hours this week
 - Email me or post on piazza for help!

Outline

- ADT
- Iterators
- Recursion
- Binary Search

ADTs

Abstract Data Types

- high-level description of a set of operations that can be performed on a data structure
- It defines the behavior of a data type independently of its implementation
- Cannot instantiate
- What does this remind you of that we've learned so far?

Queue ADT

<https://docs.oracle.com/javase/8/docs/api/java/util/Queue.html>

Look at the “Implementing Classes”

Abstract Data Types

- There are multiple ways to implement a data structure each with different trade offs
 - Ex. stack can be implemented with an array or a linked list
- **List ADT:**
 - supports a *linear sequence of elements*

Lists

java.util.List ADT

- `size()`: Returns the number of elements in the list.
- `isEmpty()`: Returns a boolean indicating whether the list is empty.
- `get(i)`: Returns the element of the list having index *i*; an error condition occurs if *i* is not in range $[0, \text{size}() - 1]$.
- `set(i, e)`: Replaces the element at index *i* with *e*, and returns the old element that was replaced; an error condition occurs if *i* is not in range $[0, \text{size}() - 1]$.
- `add(i, e)`: Inserts a new element *e* into the list so that it has index *i*, moving all subsequent elements one index later in the list; an error condition occurs if *i* is not in range $[0, \text{size}()]$.
- `remove(i)`: Removes and returns the element at index *i*, moving all subsequent elements one index earlier in the list; an error condition occurs if *i* is not in range $[0, \text{size}() - 1]$.

Example

Method	Return Value	List Contents
add(0, A)		

Example

Method	Return Value	List Contents
add(0, A)	–	(A)

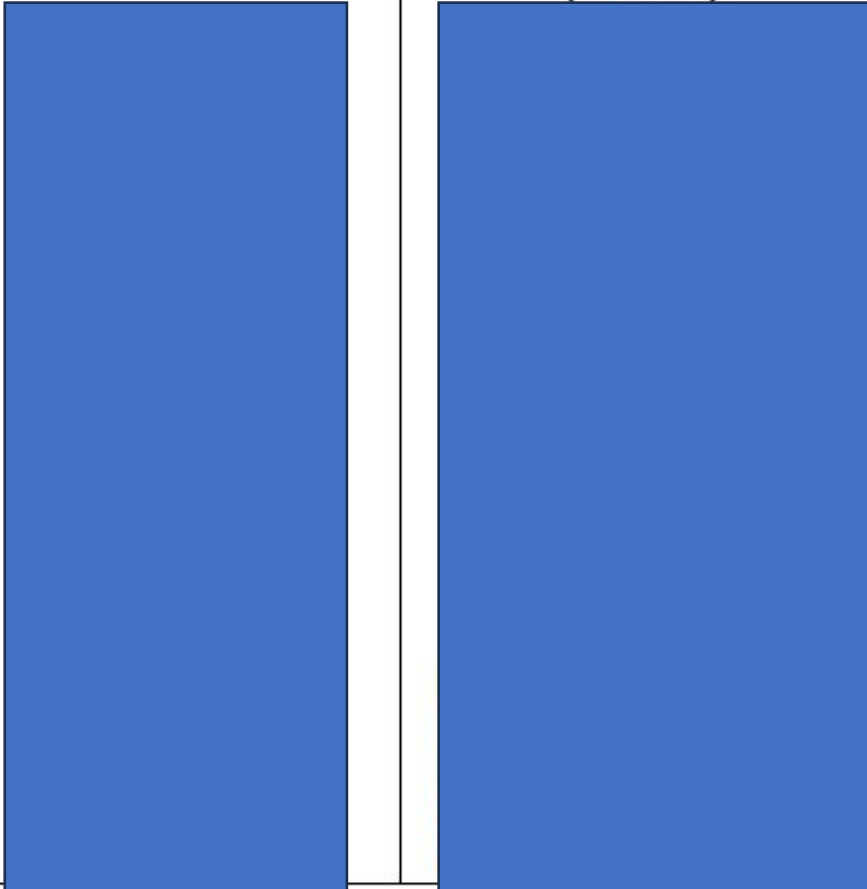

Example

Method	Return Value	List Contents
add(0, A)	–	(A)
add(0, B)		

Example

Method	Return Value	List Contents
add(0, A)	—	(A)
add(0, B)	—	(B, A)

Example

Method	Return Value	List Contents
add(0, A)	—	(A)
add(0, B)	—	(B, A)
get(1)		
set(2, C)		
add(2, C)		
add(4, D)		
remove(1)		
add(1, D)		
add(1, E)		
get(4)		
add(4, F)		
set(2, G)		
get(2)		

Example

Method	Return Value	List Contents
add(0, A)	—	(A)
add(0, B)	—	(B, A)
get(1)	A	(B, A)
set(2, C)	“error”	(B, A)
add(2, C)	—	(B, A, C)
add(4, D)	“error”	(B, A, C)
remove(1)	A	(B, C)
add(1, D)	—	(B, D, C)
add(1, E)	—	(B, E, D, C)
get(4)	“error”	(B, E, D, C)
add(4, F)	—	(B, E, D, C, F)
set(2, G)	D	(B, E, G, C, F)
get(2)	G	(B, E, G, C, F)

List ADT

<https://docs.oracle.com/javase/8/docs/api/java/util/List.html>

Look at the “all known implementing classes”

We’re going to focus on ArrayList today

List ADT

Reminder of our methods:

- `size()`: Returns the number of elements in the list.
- `isEmpty()`: Returns a boolean indicating whether the list is empty.
- `get(i)`: Returns the element of the list having index *i*; an error condition occurs if *i* is not in range $[0, \text{size}() - 1]$.
- `set(i, e)`: Replaces the element at index *i* with *e*, and returns the old element that was replaced; an error condition occurs if *i* is not in range $[0, \text{size}() - 1]$.
- `add(i, e)`: Inserts a new element *e* into the list so that it has index *i*, moving all subsequent elements one index later in the list; an error condition occurs if *i* is not in range $[0, \text{size}()]$.
- `remove(i)`: Removes and returns the element at index *i*, moving all subsequent elements one index earlier in the list; an error condition occurs if *i* is not in range $[0, \text{size}() - 1]$.

ArrayList

Big-O memory?

- $O(n)$

Indexing / random access?

- $O(1)$

Add / remove?

- $O(n)$

Iterators

Iterators

- represents a sequence of elements and provides a way to iterate, or traverse, through those elements one at a time

Iterators

- Abstracts the process of scanning through a sequence of elements (traversal)
- provides a way to iterate, or traverse, through elements one at a time

`hasNext()`: Returns true if there is at least one additional element in the sequence, and false otherwise.

`next()`: Returns the next element in the sequence.

- Combination of these two methods allow a generic traversal structure

```
while (iter.hasNext()) {  
    iter.next();  
}
```

Iterators

- **code**
- Can an iterator go backwards? NO. Only can do `next ()`

Iterable Interface

- What can i use an `iterator` on? Anything that implements the `iterable` interface.
- Each call to `iterator()` returns a new iterator instance, thereby allowing traversals of a collection
- `List` interface extends `Iterable` and `ArrayList` implements `List`

Iterable Interface

An interface with a single method:

- `iterator()` : returns an iterator of the elements in the collection

Iteratoror Interface

Iterator Interface

Another interface that supports iteration

- `boolean hasNext()`
- `E next()`
- `void remove()`

- `Scanner` **implements** `Iterator<String>`
- `ArrayList` **inner class** `ArrayListIterator` **implements** `Iterator`

Let's make ExpandableArray iterable

Iterable **versus** Iterator?

- Iterable

- `java.lang`
- **override** `iterator()`
- Doesn't store the iteration state
- Removing elements during iteration isn't allowed

- Iterator

- `java.util`
- **Override** `hasNext()`, `next()`
- **Optional** `remove()`
- Stores iteration state (list cursor)
- Removing elements during iteration supported

Outline

- Runtime
- **Recursion**
- Binary Search

Recursive functions – base case

Conditional statement that prevents infinite repetitions

Usually handles cases where:

- input is empty

- problem is at its smallest size

Recursion Example - Factorial

- What is a factorial? $n!$
- product of all integers less than or equal to n
 - $n! = n * n-1 * n-2 \dots 1$
 - $5! = 5 * 4 * 3 * 2 * 1$
 - $4! = 4 * 3 * 2 * 1$
 - $3! = 3 * 2 * 1$

Visualizing recursion – Factorial example

factorial(5) =

= 5 * factorial(4)

= 5 * 4 * factorial(3)

= 5 * 4 * 3 * factorial(2)

= 5 * 4 * 3 * 2 * factorial(1)

= 5 * 4 * 3 * 2 * 1

Recursion Example – Contains letter

Write a method called “containsLetter” that determines if a String contains a given character

Question: What are the parameters?

1. The character to look for
2. The string to be looking in

Question: What is the return type?

Code it!

Recursion Visualization – Contains letter

```
contains("l", "apple") =  
    contains("l", "apple")  
        contains("l", "pple")  
            contains("l", "ple")  
                contains("l", "le")  
                    return true
```

Recursive Method

Break problem down into smaller subproblem that we can repeat

Base case(s):

- no recursive calls are performed
- every chain of recursive calls must reach a base case eventually

Recursive calls:

- Calls to the same method in a way that progress is made towards a base case
- Often called “the rule”

Outline

- Runtime
- Recursion
- **Binary Search**

Binary Search

- efficient search in a sorted list
- can be implemented **recursively**

Search steps:

1. Calculate midpoint
2. Compare the value at the midpoint with the target value
 - a. if equal:
 - i. return index
 - b. if target value $<$ midpoint value:
 - i. **search** the left portion of the list
 - c. if target value $>$ midpoint value:
 - i. **search** the right portion of the list

Binary Search

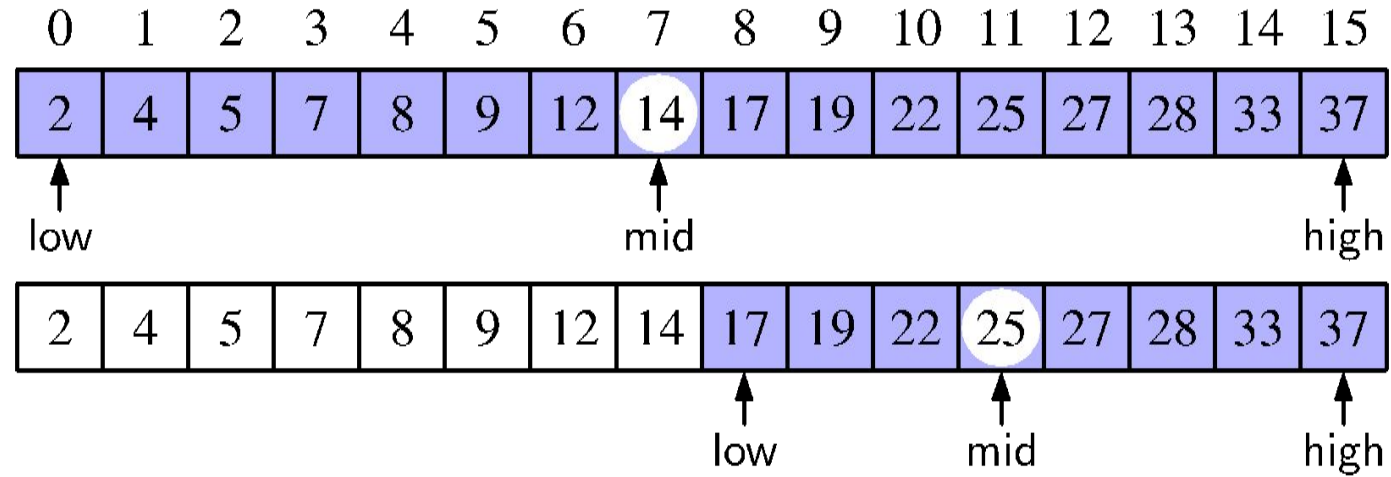

Search for an integer (22) in an ordered list

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
2	4	5	7	8	9	12	14	17	19	22	25	27	28	33	37

target = 22

target = 22

target = 22

target = 22

Binary Search Implementation

Binary Search Analysis

Each recursive call divides the array in half

If the array is of size n , it divides (and searches) at most $\log n$ times before the current half is of size 1

$O(\log n)$

Comparable

Binary search on a list of objects requires that the objects have natural ordering

In other words, the objects must implement Comparable

Summary

- iterators
 - What is the **Iterable** interface?
 - What is the **Iterator** interface?
- Binary Search
 - runtime complexity?
 - more, less, or equal efficiency to a linear search?
